

PATIENT JOURNEY

JAWLINE RESHAPING

GENDER

Female

AGE

27 years old

PROCEDURE

Liposuction with skin tightening using radio-frequency and ultrasound energy.

OPERATION DURATION

30 minutes - day case

CLINIC

Amwaj Polyclinic

JOURNEY

This young patient had struggled to get the jawline of her dreams despite a healthy diet and exercise. Localised fat was obscuring her jawline and she felt predisposed to never having a defined jawline. The patient wanted a more sculpted jawline to help restore her youthful contours and a rejuvenated appearance.

TREATMENT

The patient underwent Liposuction with skin tightening using high frequency radio-frequency and ultrasound energy. It is a small procedure undertaken under local anesthesia and IV sedation. Liposuction of the jawline area was undertaken to remove fat and give a nicely defined jawline. There is no skin peeling, pigment change or prolonged healing. The radio frequency energy and ultrasound heats the surface under the skin and fat causing collagen remodelling and the fat to gently dissolve.

RECOVERY & FOLLOW-UP

The patient was able to resume normal activity immediately following the treatment. She experienced a brief period of redness and swelling in the treatment area.

RESULTS

These images show the result at 6 months. The result started showing at 1 month from the surgery and continued to improve in the following 3 months to become finally stable at 6 months.

"I am very pleased with my results! I am just so impressed with the entire experience!"
