

PATIENT JOURNEY

UPPER BLEPHAROPLASTY

GENDER

Female

AGE

31 years old

OPERATION DURATION

One hour

POST OP CONSULTATIONS

Week 1, Week 2, Month 1, 2, 3

CLINIC

AIG Clinic

JOURNEY

This patient was bothered by her upper eyelid and wanted a more attractive eye shape.

TREATMENT

The patient underwent an Upper Blepharoplasty. This procedure involves identifying the upper eyelid crease on each eyelid and designing a skin excision

that removes enough skin to alleviate the issue and preserves enough to allow normal eyelid closure. In some cases, a small amount of the orbicularis oculi (the muscle that closes the eyelid) is removed. Fat is typically preserved over the middle of the eyelid, but some removal may help with aesthetic contour in cosmetic eyelid surgery.

When the procedure is complete, the eyelid is closed with sutures. The incision lies in the eyelid crease, making it less visible after healing.

RECOVERY & FOLLOW-UP

The patient was able to resume light activities after one week from the procedure. She experienced some swelling for brief period but she was recovered faster than expected.

RESULTS

The pictures above are post 3 months of the surgery. The patient loved the results

"I was slightly nervous before hand but Dr. Vigo made me feel at ease and I couldn't be happier with the results, really pleased I finally went!"
