

HAIRLOSS IN WOMEN

Many women experience hair loss (alopecia) at some time in their lives; among postmenopausal women, as many as two-thirds suffer hair thinning or bald spots. Hair loss in women often has a greater impact than hair loss does on men because it's less socially acceptable for them. Alopecia can severely affect a woman's emotional well-being and quality of life.

The main type of hair loss in women is the same as it is men. It's called androgenetic alopecia, or female (or male) pattern hair loss. In men, hair loss usually begins above the temples, and the receding hairline eventually forms a characteristic "M" shape; hair at the top of the head also thins, often progressing to baldness. In women, androgenetic alopecia begins with gradual thinning at the part line, followed by increasing diffuse hair loss radiating from the top of the head. A woman's hairline rarely recedes, and women rarely become bald. Hair loss in women can be frustrating, but recent years have seen an increase in treatments for coping with the problem.

WOMEN AND HAIR LOSS
